SPRINT NETWORKS

SECURE ACCESS SOLUTION

SASE

Networking as a Service — Security as a Service

Secure Access Service Edge

Change in Cyber Security Landscape

In the age of edge computing, the cloud and, more recently, Covid-19, our modern workforce has now become perimeter-less and highly distributed. Sprint Networks Secure Access Solution is a cloud-native approach that doesn't force traffic through the old data center. It is therefore a natural solution for managing this new distributed, perimeter-less world.

Users are working from home and are connecting to resources that are also highly distributed, such as multiple public clouds, containers and SaaS applications, as well as traditional data centers. This makes the old centralized "hub-and-spoke" topology, whereby remote users connect to the data center over a VPN, obsolete because modern enterprises doesn't look like that anymore.

CYBER SECURITY CHALLANGES FACED BY COMPANIES WITH THE RISE IN REMOTE WORK

Rising rates of phishing attacks
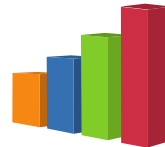

Protecting Sensitive Data

Employees connecting to public Wi-Fi

User Authentication

Lack of visibility of Bring Your Own Device

Increase in cyber attack surfaces

Unencrypted File Sharing

Weak Passwords

Securely Work From Anywhere

The shift of enterprises to modern architecture centred around cloud and mobile, requires a modern security architecture to enable the business to securely leverage their new investments. The SASE (Secure Access Service Edge) architecture is becoming the modern architecture to allow both security and connectivity for the modern enterprise. Sprint Networks Secure Access Solution allows enterprises to seamlessly migrate existing networks to SASE to leverage a whole host of cloud services for an unbeatable price.
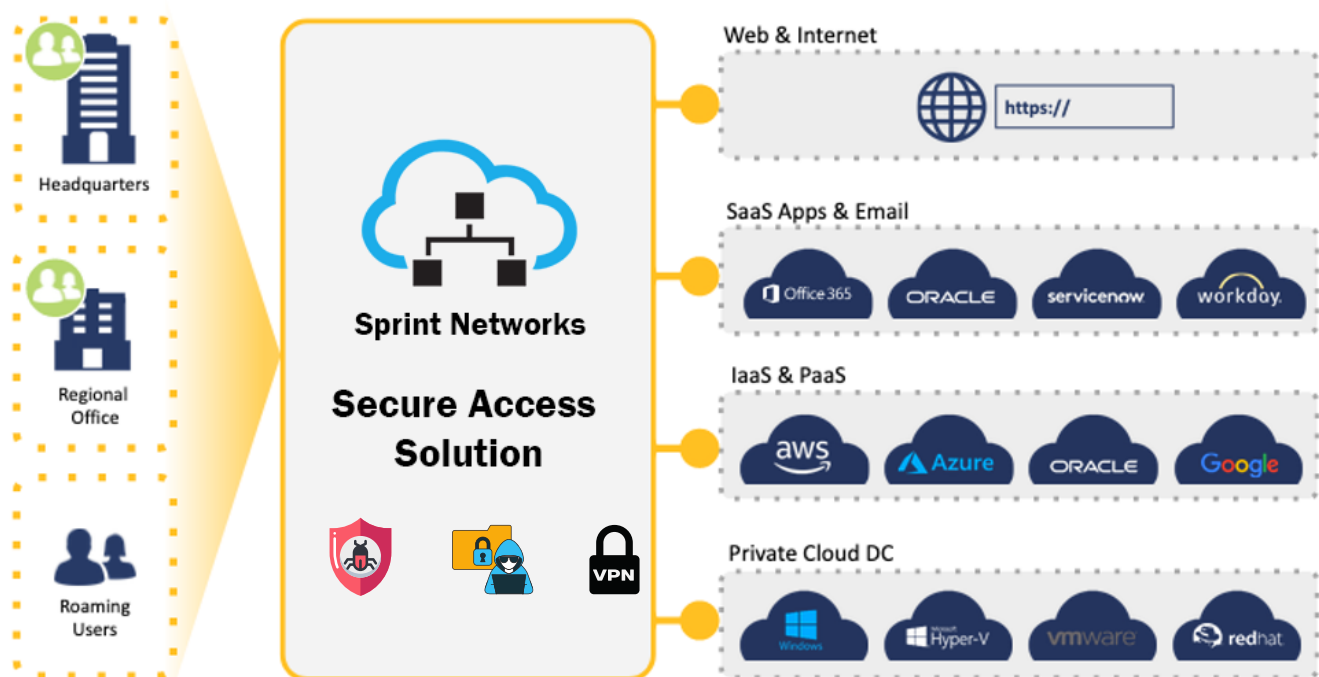

Sprint Networks Secure Web Gateway

KEY FEATURES

- Prioratise business critical traffic

- Ensure business continuity with dual internet connections

- Web application and API protection

- Eliminate legacy VPN

- SD-WAN

- Cloud Access Service Broker (CASB)

- Secure Web Gateway (SWG)

- WiFi hotspot protection

- Remote browser isolation

- Firewall as a Service (FWaaS)

- Secure standard NBN

- Zero Trust Network Access (ZTNA)
